

Security Guide

This document covers security best practices for the Student Management application.

Authentication and Authorization

The application uses ASP.NET Core Identity for authentication. Users must log in with a valid email and password. Google OAuth is available as an alternative login method.

Role-Based Access Control

Two roles are available: User and Admin. Regular users can access Students, Courses, Enrollments, and Chat. Admins can additionally manage users and assign roles.

Data Protection

All data is encrypted in transit using HTTPS. Passwords are hashed using ASP.NET Core Identity's password hasher. The application enforces HTTPS redirection and security headers.

Two-Factor Authentication

Two-factor authentication using TOTP is available for enhanced security. Users can enable it from their profile page. It is recommended for administrative accounts.
